                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ಹ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes DNA which participates in the regulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of expression of PEBP2 alpha A gene. The DNA produces a regulation protein with the activity of promoting bone formation and can serve as promoter for prevention and treatment of bone diseases including osteoporosis. The present sequence represents a PCR primer used in an example from the present invention.

WPI; 2002-730574/79.

Novel purified nucleic acid sequence encoding human calcium channel alpha2delta subunit protein, useful for detecting, preventing and treating cancer, stroke, brain trauma, Huntington's disease, myocardial infarction

Example 7; Column 47; 77pp; English.

The invention relates to a purified nucleic acid sequence (referred as CACNA2D2 gene which encodes human calcium channel alpha2delta-2 subunit protein) comprising a fully defined alpha2delta splice isoform 1, 2 or 3 nucleic acid sequence, or its complement and the encoded proteins.

Also include are: (1) a method of producing a calcium channel protein which involves introducing a recombinant expression vector comprising the CACNA2D2 nucleic acids and encoding the calcium channel protein, into a cultured host cell under conditions such that the host cell expresses the amino acid sequences; and (2) a method for co-expressing calcium channel proteins, comprising out the method of (1), but with one or more than one expression vector comprising one or more nucleic acid sequences encoding the splice variants. CACNA2D2 nucleic acid is useful sequences encoding the splice variants. CACNA2D2 nucleic acid is useful for treating patients with lambert-Eaton myasthenic syndrome (LEMS) (an autoimmune disease) and for identifying compounds

channel protein activity (e.g. epilepsy, migraine, episodic ataxia, cancer, stroke, brain trauma. Alzheimer's disease, multinfarct dementia, CC cancer, stroke, brain trauma. Alzheimer's disease, multinfarct dementia, CXOISA-KOff's disease, amyotrophic lateral sclerosis, convulsions, control of disease, ammeeia, cardiac arrhythmia, angina pectoris, hypoxic damage to the cardiovascular system, ischaemic damage to the cardiovascular system, ischaemic damage to the cardiovascular system, congestive heart failure, muscular dystrophy and hyportension) CACNA2D2 nucleic acid is useful as primers and probes for detecting presence of nucleic acid is captance encoding at least a portion of calcium channel protein, in detection, identification and isolation of alpha2delta sequences diagnosing and typing of preneoplasias and cancers, since genetic cid supption of 3p21.3 region (in which the alpha\_2delta gene is located) is common in cancer (e.g. lung cancer and breast cancer) and preneoplastic lesion (e.g. lupperplasia, dysplasia, carcinoma in situ). The present is an SSCP (single strand change polymorphism) PCR primer channel alpha2delta encoding a human calcium channel alpha2delta and colium channel alpha2delta carcinoma in situ). channel alpha2delta splice isoform protein.

Example 10; Page 47; 55pp; Japanese.

The invention provides a leukotriene receptor, which binds leukotriene B4 and polynucleotides encoding the leukotriene B4 receptor. The receptor can be expressed by standard recombinant methodology. Pharmaceutical compositions containing materials which modify the receptor activity, other than 4-octyloxybenzene carboximidoamide are used for treating and preventing inflammatory disease. The materials detected by screening the 

ò Gaps receptor (JULF2) are useful for treating diseases such as bronchitis, dermacitis, psoriasis, ulcerative colitis, rheumatoid archritis, and edema. Sequences AA166614-13 represent PCR primers for amplifying a rat leukotriene B4 receptor JULF2 DNA. 0 Score 11; DB 1; Length 20; Pred. T-cell Monitoring the immune system for prevention and/or treatment of mediated diseases e.g. allergy, autoimmunity or cancer, involves detecting modulation of Notch signalling

Disclosure, Fig 13; 75pp; English.

The present invention relates to a new method for monitoring the immune system that involves detecting modulation of Notch signalling. The method of the invention can be used for monitoring the immune system such as detecting or monitoring T-cell activation or inactivation, immunological colerance or activity, monitoring the efficacy of immunotherapy and for detecting or monitoring the reactivity of a T-cell to an antigen e.g. for detecting increased or decreased reactivity of a T-cell to an antigen and detecting tolerisation of a T-cell to an antigen and detecting tolerisation of a T-cell to an antigen. The method is used in the complex the antigen is self or foreign antigen. The method is used in the prevention and/or treatment of T-cell mediated diseases such as asthma, or prevention and/or treatment of T-cell mediated diseases such as asthma, alleray, autoimmunity, graft rejection, tumour induced aberrations to the prevention and/or treatment of T-cell mediated diseases caused by e.g. Cytomegalovirus, beauchomonas, Toxoplasma, Microfilariae, Helminths, Mycobacteria, human immunodeficiency virus (HIV), plasmodium species, Echinococcus, communodeficiency virus (HIV), plasmodium species, Echinococcus, comethod is also used for the transplantation. The present assay cuthritis, diabetes and for organ transplantation. The present assay method provides a much more objective measure of the effectiveness of

```
therapy than the rather subjective symptoms-based measures which are often used at present. The ability to detect an immune response could be used in identifying the cause of an allergic reaction by monitoring the activity of the immune system in the presence of different potential allergens. The assay could be used to check for successful immunisation against a given disease antigen. The present nucleic acid sequence represents the human HES-1 (hairy-enhancer of split-1) forward PCR primer that was used in the invention with the HES-1 reverse PCR primer (ABK15888) and the HES-1 probe (ABK09925) for real-time PCR of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This 3' primer and a 5' primer (see AAV47651) are based on an area of non-homology between murine protein tyrosine kinase 2 (PYK2) and focal adhesion kinase (FAK) that is adjacent to the C-terminus of the kinase domain. They were used in a PCR amplification of CDNAs of mouse osteoblastic MB1.8. The PCR product (700 bp) was used as a FAK-specific probe to isolate mouse FAK CDNA. The invention relates to new nucleic acid (see AAV47653) encoding mouse PYKZ (see AAW61196), a member of the FAK family. PYKZ can be used in a claimed method for identifying specific modulators of PYKZ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding murine protein tyrosine kinase 2 and cells expressing the recombinant kinase - used to identify specific modulators, potentially useful for controlling the level of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This oligonucleotide is based on a non-homologous region, found adjacent to the C-terminal of the kinase domain, of murine protein tyrosine kinase 2 (PYK2) and focal adhesion kinase (FAK) sequences. It was used as a 3 primer, together with a 5' primer (see AAV45666), in the PCR amplification of mouse osteoblastic MB1.8 cell cDNA. The PCR product was used as a FAK-specific probe to isolate full-length FAK cDNA. FAK shows homology to murine PYK2 (see AAW6568), another cell adhesion-dependent kinase. Agents that bind to and modulate PYK2 are isolated using methods of the invention, and are useful in treating osteoporosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

```

The invention relates to a typing kit for judging human leukocyte antigen (HIA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleorides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HIA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved mucleic acids relating to gene polymorphisms. The method is useful for judging HIA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of pancreas, largerhans islet in pancreas and cornea, susceptibility diancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals.

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases

Claim 3; Page 40; 72pp; English.

regulates expression of a sequence encoding a subunit of nuclear factor.

Kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating FEL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, centiables are also useful for treating inflammatory disease such as charactering and antisense nucleic acid molecules are also useful for treating inflammatory disease such as charactering archivity and antisease such as charactering activity and antisease such as charactering and antisense such as charactering activity and antisease such as charactering and antisense such as charactering activity and antisease such as charactering and antisense such as charactering activity and antisease such as charactering activity and antisease such as charactering activity and antisease such as charactering and antisense such as charact invention describes an enzymatic nucleic acid molecule (I) which down rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (Central nervous system (CNS) and mycoardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule.

Drosophila circadian rhythm period gene; circadian clock gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human genes. The RIGHI polypeptides act as regulators of circadian rhythms. The identification of RIGHI as a putative circadian clock gene provides a useful tool to explore the molecular mechanism of the mammanian circadian machinery. Using interaction screening approaches, it should be possible to find interaction screening perhaps in the form of a Drosophila Timeless orthology. Furthermore, promoter analyses of the RIGHI genes should uncover how light cues and possibly other environmental stimuli, regulate the expression of this gene. Targeted disruption of the might gene using stem cell technology, may provide a valuable model system to study the various physiclogical and pathological aspects of disrupting circadian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Primers AAX26903-04 were used for STS-PCR mapping of RIGUI nucleic acids. RIGUI is a gene corresponding to the Drosophila circadian rhythm period gene. The specification describes both mouse and

The invention describes a polynucleotide (I) of the endothelin (EDNR) /endothelin converting enzyme (ECB)/receptors of EDN and ECE (EDNR) (C (EDN)/endothelin converting enzyme (ECB)/receptors of EDN and ECE (EDNR) (C (EDN)/endothelin spassociated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing and a molecular variant gene comprising (I) is useful for identifying and cotaling a product, or for identifying and obtaining an inhibitor of the activity of a molecular variant of a polypeptide of the activity of a molecular variant of a polypeptide of the activity of a collectular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and correctlides encoding them are useful for preparation of a polymential angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercolaster comparison, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercolaster comparison of a solvated proteins and correcting a transgenic animal and in creation of a solid support comparising polymucleotides, genes or expresents a PCR primer used to comprising polymucleotides, genes vectors, polypeptides, and tibodies or host cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Endothelin converting enzyme 1 (ECE-1) SNP detection primer #62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The invention relates to a novel isolated nucleic acid encoding human invention has cytostatic activity. The nucleotide may have a use in gene therapy. The KTOM1 (Midney tumour oversxpressed membrane) protein. The protein of the therapy. The KTOM1 nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOM1.

Compositions comprising the nucleic acids, proteins or antibodise may be used to treat subjects having defects in KTOM1 which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a probe used in the invention to scan the nt 1-1001 portion of human KTOM1a (ABQ631232).

Human sentrin phosphorothioate antisense oligonucleotide SEQ ID NO:47.

(first entry)

03-FEB-2000

AAZ35905;

AAZ35905 standard; DNA; 18 BP.

AAZ35905

Human, sentrin, antisense oligonucleotide, phosphorothioate, inhibition, modulation, expression, diagnosis, ss.

1..18 /\*tag= a /note= "phosphorothioate linkages"

Antisense compound which modulates human sentrin expression, useful for treating diseases associated with sentrin expression -

Example 15; Column 38; 29pp; English.

The present invention describes an antisense compound (I) 8-30 nucleotides long targeted to a nucleic acid molecule encoding human sentrin. The antisense compound comprises a phosphorothioate antisense oligonucleotide which inhibits expression of human sentrin. (I) is useful for inhibiting expression of sentrin in human cells or tissues in vitro, for treating humans or other animals suspected of having or being prone to a disease associated with sentrin expression. (I) can also be used for research or diagnostic purposes. The present sequence represents a human sentrin phosphorothioate antisense

Sequence 18 BP; 4 A; 5 C; 3 G; 6 T; 0 other; oligonucleotide from the present invention.

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids. (SL, ABBR3999), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GPPsass as well as downstream components of the signal transduction pathway. (I) is useful of or identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disagnes and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating creates the sequence is that of a scanning oligonucleotide useful in examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent

à 쉄 The present invention describes a method (M1) of determining an individual's predicting the individual's response to medication. The as well as predicting the individual's response to medication. The method comprises determining the genotype of at least one gene selected from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation which shows a linkage disequilibrium. SCN1A, SCN2A and SCN3A are all codium channel genes located on chromosome 2. The idopathic generalised epilepsy (IGE) gene is more specifically localised on chromosome 2423-431. Compounds identified as modilators of the biological activity epilepsy or other neurological Assorders. They have anticonvulsant and neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to AAH59679 represent SCN1A, SCN2A, and SCN3A converse and proteins given in the exemplification of the present invention. epilepsy Determining a predisposition to epilepsy and/or development of epileps comparises determining the genotype of SCNIA, SCNZA and/or SCN3A, or a DNA variant, equivalent, or mutation which shows a linkage disequilibrium -Cossette P, Ragsdale D; Rochefort D, Example 3; Fig 2; 268pp; English. 24-NOV-2000; 2000WO-CA01404. Ribozymes targeted to interleukin 2 - useful for treating e.g. cancer, autoimmune disease and allergies

Claim 4; Page 44; 61pp; English.

The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AAV9455 to AAV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor.

The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer -

sequencing the human insulinoma-associated antigen, IA-1 cDNA clone. The IA-1 function as a regulatory factor in islet cell transformation. The IA-1 is used as a tumour marker for diagnosis and identification of insulinoma and neuroendocrine tumours. It is also used for identifying cancers. Correct identification of insulinomas and cancers is possible. The IA-1 fragments may be used to immunise animals for the generation of polyclonal and monoclonal antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of a primer used in the PCR amplification of the open reading frame of a cDNA clone (see AAA29150) encoding human phosphatidylethanolamine N-methyltransferase-2 (PEMT-2, see AAY79199). The PCR product was subcloned into mammalian expression vector pCI, and PEMT-2 was expressed in rat hepatoma McAAdle-RH777 cells. The invention relates to novel human PEMT2 polymucleotides and protein (see AAY79199), and to methods of using them in the treatment and diagnosis of liver

                                                                                                                                                                                                                                                                                                               à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel insulinoma-associated neuroendocrine tumor-associated cDNA, useful for diagnosing and identifying insulinoma, neuroendocrine tumors
                                                                                                                                                                                                                                                                             New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

PD-ATP-binding cassette; PD-ABC; chromosome 19p13.3; spleen; thymus; ds;

form 2 DNA exon 11 3' splice site.

Human PD-ABC

(first entry)

peripheral blood leukocyte; bone marrow; lymph node; dyslipidaemia; cardiovascular disorder; inflammatory disorder; abnormal calcium flux; epilepsy; coronary artery disease; Tangler's disease; atherosclerosis; familial high-density lipoprotein deficiency; fatty liver disease; atherosclerosis, diabetes; insulin resistance; obesity; drug screening; alcoholism; retinal degeneration; hypertension; vascular disease.

CCCGGCTGCTGGGCTAC 18

```
The sequence represents a splice site within a DNA molecule encoding human PD-Arp-binding cassette (PD-ABC) protein. PD-ABC maps to chromosome 19P13.3 and is expressed in various tissues including spleen, thymus, peripheral blood leukocytes, bone marrow and lymph nodes. The PD-ABC DNA molecules and proteins are used to diagnose and treat cardiovascular disorders, inflammatory disorders, dysliptdemia, epileps, diseases related to abnormal calcium flux, coronary artery disease, Tangier's disease, fantlial high-density lipoprotein deficiency, atherosclerosis, diabetes, fatty liver disease, insulin resistance, obesity, alcoholism, retinal degeneration, hypertension and vascular disease. The sequences are also used in drug screening assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ^{\prime} Human PD-ABC DNA molecules and proteins for diagnosis and treatment dyslipidaemia, epilepsy and diseases related to abnormal calcium flux

```
The sequence represents a splice site within a DNA molecule encoding human PD-ATP-binding cassette (PD-ABC) protein. PD-ABC maps to chromosome 19pl3.3 and is expressed in various tissues including spleen, thymus, peripheral blood leukcytes, bone marrow and lymph nodes. The PD-ABC DNA molecules and proteins are used to diagnose and treat cardiovascular disorders, inflammatory disorders, dyslipidaemia, epilepsy, diseases related to abnormal calcium flux, coronary artery disease, Tangier's disease, fanty liver disease, intoprotein deficiency, atherosclerosis, diabetes, fatty liver disease, insulin resistance, obesity, alcoholism, retinal degeneration, hypertension and vascular disease. The sequences are also used in drug screening assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Secreted protein, human; PRO protein, neoplastic cell growth; tumour; proliferation; leukaemia; lymphoid malignancy; inflammatory disorder; angiogenic disorder; immunologic disorder; PRO6496; PCR primer; ss.

The specification describes a beta-secretase enzyme. The enzyme cleaves beta-amyloid precursor protein to produce beta-amyloid peptide. This enzyme is therefore implicated in the production of amyloid plaque components which accumulate in the brains of individuals afflicted with a Latenance's disease. Inhibitors of beta-secretase are administered to a mammalian subject e.g. with Alzheimer's disease or Alzheimer's disease-like pathology to test if they maintain or improve cognitive ability or reduce the plaque burden. The compounds are used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease. PCR primers AAA59530-49 were used to amplify DNA encoding beta-secretase
                                                                                                                                                                                                                                                                                                                                                                                   Purified beta-secretase protein used in assays to discover inhibitors which can be used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a PCR primer used to isolate DNA encoding human PRO5800 protein of the invention. The PRO proteins are secreted proteins. Antagonists or antibodies of PRO polypeptides are useful for diagnosing and treating tumours are associated with gene amplification. Hooplastic cell growth and proliferation in mammals, and those conditions contactived by oversynession and/or activation of the amplified genes. Such conditions include benign or malignant tumours (e.g. renal, liver, kidney, bladder, breast, gastric, ovarian, colorectal, prostate, tidney, bladder, breast, gastric, ovarian, colorectal, prostate, giloblastomas and various head and neck tumours); leukaemias and lymphoid malignancies; neuronal, glial, astrocytal, hypothalamic, and other alignancies; neuronal, glial, stromal and blastocoelic disorders; and inflammatory, angiogenic and immunologic disorders. These may further be used to qualitatively or quantitatively detect the expression of proteins encoded by the amplified genes, and in tumour diagnostics or proparation of a medicament in the treatment of a condition, which is responsive to the PRO polypeptide, its antagonist or anti-PRO antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases

Claim 3; Page 38; 72pp; English

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (1) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (1) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, cervical, head and neck, overian cancer, melahoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug chemotherapy including paciltaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, caid molecules are also useful for treating inflammatory disease such as acid molecules (2) and artistense nucleic contemporal arthritis, restensing inflammatory disease such as contemporated arthritis, restensing inflammatory disease such as contemporated arthritis, restensing a lunian (2) chomic arthritis restensing and inflammatory disease such as chamatoid arthritis, restensing and property contemporated arthritis, restensing and property contemporate and antistensing and property contemporated arthritis, restensing and property contemporated arthritis, restensing and property contemporated arthritis and property contemporated and property contemporated arthritis and property contemporated and property contemporated arthritish contemporated and p invention describes an enzymatic nucleic acid molecule (I) which down rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft (central nervous system (CNS) and myocardial), glomerulonephritis, sepsits, allergic airway inflammation, inflammatory bowel disease or enzymatic nucleic acid molecule.

Novel enzymatic nucleic acid molecules which down regulates expression

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, ossophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, caid and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rhemmatoric as the useful for treating inflammatory disease such as rhemmatoric as the useful for treating inflammatory disease such as rhemmatoric as the page of the contact of the cancer of an antisense and an arrespondent or reductions. invention describes an enzymatic nucleic acid molecule (I) which down of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases Claim 3; Page 33; 72pp; English.

The present invention describes a nucleic acid molecule (NA) (I) encoding a bovine acyl CoA-diacylglycerol transferase (DGAT) contributing to or indicative for low fat content of milk and to low meat marbling (intramuscular fat content). Human DGAT is located to chromosome 8, and bovine DGAT is located to chromosome 8, and the mammal for its predisposition for fat content of milk and/or its bovine DGAT is predisposition for meat marbling. The method comprises analysing the redisposition for meat marbling. The method comprises analysing the predisposition for meat marbling. The method comprises analysing the gene encoding DGAT for nucleotide polymorphisms (SNPs) which are connected with the predisposition. The nucleotide polymorphisms are located in the coding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polypeptide which is encoded by the gene. The nucleotide acid molecule has at the position 10433 and 10434 of the DGAT gene a guanine, 11030 a guanine, 11048 a cytosine or thymine and 11093 a corresponding to position 10433 and 10434 of the DGAT gene two adenine corresponding to position 10433 and 10434 of the DGAT gene two adenine cresidons which is responsible for the regulation for high content of milk and high meat marbling. The nucleotide polymorphisms are located in a region which is responsible for the regulation of the expression of the product of the gene encoding DGAT. ABZ7045 at ABZ7045 and ABBP6035 to invention.

meat marbling

The present invention describes a nucleic acid molecule (NA) (I) encoding a bovine acyl CoA-diacy1glycerol transferase (DGAT) contributing to or indiactive for low fat content of milk and to low meat marbling (intramuscular fat content). Human DGAT is located to chromosome 8, and (intramuscular fat content). Human DGAT is located to chromosome 8, and bovine DGAT is located to chromosome 14. (I) is useful for testing a mammal for its predisposition for fat content of milk and/or its predisposition for meat marbling. The method comprises analysing the gredisposition for medial polymorphisms (SNPs) which are connected with the predisposition. The nucleotide polymorphisms (SNPs) which are connected with the predisposition. The nucleotide polymorphisms are located in the coding region of the DGAT gene and result in substitution, deletion and/or addition of an amino acid sequence of the polypeptide which is encoded by the gene. The coding regular and a cytosine residue, at position 10433 and 10434 of the DGAT gene a guanine, and a cytosine residue, at position 1993 and 1993 a cytosine or thymine, which correlate with a predisposition for low fat content of milk and low meat marbling. The nucleic acid molecule has at the position corresponding to position 10433 and 10434 of the DGAT gene two adenine residues which correlate with a predisposition for high content of milk and high meat marbling. The nucleotide polymorphisms are located in a region which is responsible for the regulation of the expression of the present invention invention.

Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                       AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diseascing methods, as well as the characterisation of the differential efficacious responses to and side
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               N.B. The SEQ ID NOs 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 20 BP; 5 A; 2 C; 9 G; 4 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                treatment.
                                                                                                                                                                                                                                                   Cohen D,
```

The present invention describes an antisense compound (1), 8 to 30 nucleobases in length, that is targeted to a nucleic acid molecule encoding STAT3 (Signal Tranaducer and Activator of Transcription) and which inhibits the expression of it. (1) has antinflammatory, it is used to inhibiting the expression of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a number having a disease or condition daracterised by a reduction in a poptiosis, and inducing apoptosis in a cell. Diseases or conditions that are treated are rheumatoid arthritis, cancer of the breast, prostate, brain, head and/or neck, lenksemia, myeloma, melanoma or lymphoma. (1) can also be used for diagnostic methods in detecting and determining the role of STAT3 in various cell functions, physiological processes and conditions and for diagnostic methods in detecting as an immunostimulator. (1) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC93231 encodes mouse STAT3 as given in the exemplification of the present invention. AAC93151 to AAC93230 and AAC93232 to AAC93299 represents a mismatch control.

New antisense compound for inhibiting the expression of signal transducer and activator of transcription 3 (STAT3) in cells or tissues and treating diseases or condition associated with STAT3, such as rheumatoid arthritis and cancer -

```
The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (STAT) protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense sequences are useful for inhibiting the expression of STAT3 in cells or tissues, inducing are apoptosis in cells, and sensitising cells to apoptosis. They are also useful for treating an animal having a disease or condition associated with STAT3. These disorders include inflammatory or autoimmuse the presst, prostate, brain and head and neck and leukaemias, myslomas. They breast, prostate, brain and head and neck and leukaemias, myslomas. They are sequences of the invention can disease or conditions apoptotic signals. The sequences of the invention can be used in clinical research, for detecting and determining the role of STAT3 in various cell suscitions and physiological processes and for diagnosing conditions and associated with the expression of STAT3. The sequences represent cDNA and also associated with the expression of STAT3. The sequences represent cDNA and also associated with the expression of STAT3.
                                                                                                                                                                                                                                                        Novel antisense compound useful for treating and diagnosing inflammatory diseases and cancers, is targeted to a nucleic acid molecule encoding signal transducer and activator of transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              KSHV; gamma herpes virus; glycoprotein B; vaccine; infection;
human Kaposi's sarcoma-associated herpes virus; probe; primer;

The oligonucleotide may be used for detecting viral DNA or RNA in a sample of primate origin, especially in the diagnosis of herpes viral infection. Herpes virus DNA polymerases of this invention, may be used in vaccines for the protection against infection by a herpes virus of the RFHV/KSHV
                                                                                                     DNA encoding glycoprotein B of retroperitoneal fibromatosis and Kaposi's sarcoma associated herpes viruses - useful in vaccines for treatment of herpes infection or for detection of viral DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Herpes virus DNA polymerase and corresponding nucleotide sequence used in the detection and treatment of herpes virus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Retroperitoneal fibromatosis herpes virus, detection, infection, Kaposi's sarcoma herpes virus; viral DNA, viral RNA, vaccine;
                                                                                                                                                                                           Claimed type 3 oligonucleotides (AAT84694-96) are specific non-degenerate oligonucleotides for the human Kaposi's sarcomasssociated herpes virus (KSHV) DNA polymerase (gB). They can be used for detecting, amplifying or characterising KSHV polymucleotides encoding DNA polymerase (see AAT84697).
                                                                                                                                                                                                                                                                                                                                                     ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A B-cell superantigen (8Ag) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The sAg is used to enhance production of VH, especially VH3, restricted Abs. To detect Ig gamma chain expression, the antisense sequence given in AAQ64857 was used as probe. Detection of VH families used the sense oligonucleotides given in AAQ64858-60. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                       Gaps
family. They may also be used in the design and screening of anti-viral drugs. Antibodies raised against the polymerase or fragments of it, may be used in the detection of herpes virus infection and for drug targetting for the therapy of herpes virus
                                                                                                                                                       0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Stimulating prodn. of variable region gene family restricted antibodies - through B-cell super-antigen vaccination

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an ancisense oligonacleotide, (for Insulin-11ke Growth Factor [IGF]-1 receptor. [Debinding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is one such antisense oligonucleotide. The method is useful for ameliorating the effects of psoriasis, idhthyoais, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation -

Example 8; Page 66; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-IRe Growth Factor [167]-1 receptor, 1GF binding protein [1678]-2 or 1GFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serbornhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the settin, a hypernevescular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia.

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases

Claim 3; Page 33; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (1) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRM), where (I) is an inozyme, zinzyme, q-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a partient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2, The enzymatic and anticident cation, especially Mg^2, The enzymatic and anticident cation, especially Mg^2, The enzymatic and unitidivity resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule.

Enzymatic nucleic acid molecules having a hammer-head motif - used for the treatment of arthritis, induction of graft tolerance or treatment of auto-immune diseases 

Claim 10; Page 215; 307pp; English.

The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising; (i) at least 5 ribose residues; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for enhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the

New isolated IMP.18p myo-inositol monophosphatase - used to develop products for determining susceptibility to manic depressive illness and as targets for preventive and therapeutic treatments

Example 5; Page 71; 118pp; English.

A method has been developed for determining a genotype associated with increased susceptibility to manic-depressive (MD) illness. The method comprises determining the genotype of an affected individual with at least one polymorphic marker localised within the chromosomal region defined by and including markers D185843 and D185869 and determining the genotype associated with increased susceptibility to MD disorder. The method can be used for determining susceptibility to MD illness including bipolar disorder, genetic counselling of individuals from families affected with MD illness, and aid in the differential diagnosis of MD illness from other psychiatric pathologies. Products from the present invention can also be used to obtain modulators of IMP.18p myoinositol monophosphatase protein activity and as targets for preventive and therapeutic treatments. The present sequence represents a PCR primer used in the mapping of human chromosome 18 for determining the genotype of MD illness susceptibility, used in an example from the present invention

```
The present sequence is one of a number of oligonucleotides designed to target different regions of the human NF-kappa-B p65 subunit, which is a member of the Rel/NF-kappa-B family of transcription factors.

Rel/NF-kappa-B proteins are involved in a diverse set of signaling pathways involving stress, apoptosis, cancer, growth, infection and inflammation. Antisense oligonucleotides are able to inhibit expression of the p65 subunit and may therefore be used in the treatment of disorders associated with NF-kappa-B p65 subunit expression. They may be used as a prophylaxis to prevent or delay infection, inflammation or tumour formation. Antisense compounds may also be used for research and
                                                                                                                                                                                                                                Human NF-kappa-B p65 subunit antisense oligodeoxynucleotide ISIS# 23738.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense compounds which inhibit the expression of the human NF-Kappa-B p65 subunit (p65) useful for treating diseases associated with p65 expression and as prophylaxis to prevent of delay infection, inflammation or tumor formation -

Primer 1 and 2 (AAQ86978-79) were used to amplify a target nucleotide sequence from methicillin resistant S. aureus (MRSA). The target is detected with a probe specifically derived from the mecA gene of S. aureus and S. epidermidis. The mecA gene product has no homology with known PBPs (penicillin-binding proteins). The new probes allow for the rapid identification of all MRS, eradicating need for labour intensive in vitro cultivation and physiological assays.
                                                                                                                                                                             MRSA; methicillin resistant Staphylococcus aureus; probe; hybridisation; mecA; MRSE; Staphylococcus epidermis; primer; PCR; polymerase chain reaction; ss.

Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells of a given species
                                                                                                                                       Example 3; Fig 16; 77pp; English.

```
The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein, (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species, and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the limmune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins. e.g. Streptokinase (SX). The products can be used for diagnosts and therapy. Sequences AAV81047-68 represent oligonucleotides used for the construction of de-immunised 708
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 18;

AAV51705-V52008 are reverse PCR primers used to amplify fragments of th Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant.
                                                                                                                                                                           species allele-specific oligonuclectide probes and primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

This sequence represents a primer for the coding sequence for the alpha epithelial sodium channel a (alphaENACa). AlphaENACa (see AAW34529) and alphaENACA (see AAW34530) represent the sequences of the invention. The two sodium channels are alternatively spliced forms of the amiloride-sensitive salt channel alpha subunit and can be used in membrane-transport or binding assays to identify substances that enhance or block perception of a salty taste. Enhances could be used as salt substitutes and blockers could be used to mask salty tastes in foods and

Patent No. 5770440

GENERAL INFORMATION:
GENERAL INFORMATION:
TAPPLICANT: Barbas, Carlos F
APPLICANT: Barbas, Carlos F
APPLICANT: Lerner, Richard A
TITLE OF INVENTION: HUMAN NEUTRALIZING MONOCLONAL ANTIBODIES
TITLE OF INVENTION: 170 HUMAN IMMUNOBEFICIENCY VIRUS
NUMBER OF SEQUENCES: 170
CORRESPONDENCE ADDRESS:
ADDRESSEE: Patent Counsel
STREET: 10666 No. 5770440th Torrey Pines Road, Suite 220,
STREET: Mail Drop TPC8
CITY: La Jolla
STATE: CA
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk

GENERAL INFORMATION:

APPLICANT: Futreal, Phillip A

APPLICANT: Mooster, Richard F

APPLICANT: Mooster, Alan

APPLICANT: Stratton, Michael R

TITLE OF INVENTION: Materials and methods relating to the

TITLE OF INVENTION: identification and sequencing of the BRCA2 cancer

TITLE OF INVENTION: susceptibility gene and uses thereof.

NUMBER OF SEQUENCES: 222

| Sequence 52, Application US/09920672
| Sequence 52, Application US/09920672
| Sequence 52, Application US/09920672
| Patent No. 6455308
| General Information Application
| APPLICANT: Mark J. Graham
| APPLICANT: Susan M. Freier
| TITLE OF INVENTION: ANTISENSE MODULATION OF SERUM AMYLOID A4 EXPRESSION
| FILE REPERENCE: RTS-0251
| CURRENT APPLICATION NUMBER: US/09/920,672
| CURRENT FILING DATE: 2001-08-01
| SEQ ID NOS: 89
| LENGTH: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
